

Exotic Vegetation Removal- Nevares Springs

A.J. pulling an exotic plant.

Excerpts from A.J.'s field notes:

Date: 7-2-02

Weather: A little warm but it's about to get warmer!

Mood: Feel like working (got some sleep).

Objective: To remove exotic vegetation that uses more water

than the native plants and crowds them out. The animals prefer to use the native plants any way.

Description of Work: Pulled out palm tree sprouts and salt cedar.

I had a lot of fun doing the project because it felt like an exploration, it was a success in the plants and small trees we managed to pull out. I learned that there is a species of insect that lives in the spring and nowhere else in the world!

Checking for exotics.
